Unit 1: Lost

"Oh, no!" Luke cries. "I'm lost again."

He **pulls over** to the side of the road and puts the car in park, trying to **hold back** the tears. He gets out of the car and looks around, hoping to see something **familiar**, but he has no idea where he is.

"This seems to happen to me a lot," he **mutters** to himself. "Thank god my wife bought me a **GPS** for my birthday!"

He **switches** the **dash-mounted** GPS on and waits for it to get a **signal**. It **responds with a beep** to let him know that it is ready for use. He then **browses** the **onscreen menus** until he finds his **destination**. A map of the area comes up and he uses the **pointer** to **select** the **exact** address that he is trying to find. Now that the GPS is **programmed**, it will lead him right to where he wants to go...the Ming-Harn Temple.

An **arrow flashes** on the screen showing him which way to go. Sometimes the machine even beeps when he needs to turn.

A GPS, or Global **Positioning** System, uses **satellites** to **communicate** information to it. In order to **calculate** your **whereabouts**, the GPS needs to be connected to at least 3 satellites, but the more satellites it connects to, the more **accurate** the information that it provides will be.

A GPS can give you other information as well. It can tell you your **altitude**, speed, and even your ETA (estimated time of arrival). It can also be programmed to record **coordinates** that are important to you, like where you buried that body last summer.

Thanks to the wonder of modern technology, Luke finally sees the big temple off in the **distance**. For a man who has spent most of his life lost and in the dark, the GPS is a **godsend**. Never will he **waver** off course again.
